CARLOS NETO

Senior DevOps Engineer

linkedin.com/c-neto | credly.com/c-neto | www.carlosneto.dev | github.com/c-neto | Brazil - São Paulo

PROFESSIONAL PROFILE

DevOps Engineer with 8+ years of experience building highly available and fault-tolerant systems. Specializing in Kubernetes, AWS, and observability at scale with OpenSearch and ELK. Strong programming background with solid Python and Bash skills. Continuous learning mindset, backed by certifications including CNCF Kubestronaut and AWS Solutions Architect.

Known for a strong sense of ownership, delivering reliable and easy-to-operate solutions with solid documentation included. Trusted to tackle complex problems with no clear path forward, conducting research to identify well-founded and sustainable solutions. Recognized by managers as a distinguished professional and a top performer in issue resolution across organizations.

Driven by a strong documentation culture and knowledge sharing, with experience creating and maintaining Knowledge Bases across teams. Active open-source contributor, with PRs merged into the documentation of projects including OpenSearch, Fluent Bit, External Secrets Operator, and OpenCTI. Technical content creator, sharing hands-on experience on the carlosneto.dev blog.

PROFESSIONAL EXPERIENCE

Senior DevOps Engineer | Trustly Inc. (Open Banking Platform)

November 2021 – Present

Work as a Senior DevOps Engineer at a Swedish fintech company, supporting Open Banking solutions across the US and Europe on a 24/7 AWS cloud infrastructure, as featured in an AWS case study.

Lead log analytics initiatives using Fluent Bit and Logstash, and manage a large-scale OpenSearch cluster (20 nodes, 100 TB of storage, 450 GB of memory) running on Kubernetes. Responsible for optimizations that increased log ingestion from 5K to 25K logs per second. Implemented fine-grained RBAC with SSO ensuring Principle of least privilege. Converted hands-on experience into open-source contributions, highlighting the first description of the Searchable nodes. Reported bugs fixed by the community, such as the Dashboards multi-cluster TLS issue, and requested implemented features such as Fluent Bit metrics for skipped long lines.

Technical reference for Helm and Python, translating business and operational needs into engineering conventions and ensuring their adoption through AI skills and agents for convention-based code generation and PR reviews using Claude and OpenCode.

Led the adoption of Helm Charts at the company, establishing conventions and providing team training. Contributor to the company's internal platform and IaC framework, ensuring the standardized delivery of systems based on GitOps and CI/CD practices using GitHub Actions, OpenTofu, Terragrunt, Helm, and Argo CD.

Main contributor to the company's Knowledge Base. Documented all operational tasks of the DevOps team, authoring more than 100 Confluence pages. Recognized across the company for attention to detail and user-friendly documentation writing.

***Technologies**: AWS, EKS, Kubernetes, Karpenter, Bottlerocket, Helm, Argo CD, Terraform, OpenTofu, Terragrunt, Kong, Istio, External Secrets Operator, Cert Manager, OpenSearch, Logstash, Fluent Bit, GitHub Actions, Python, Bash, Claude, OpenCode*

Python Developer | Fotosensores (IoT Traffic Enforcement System)

April 2018 – October 2021

Worked as a Python Developer focused on observability and system integration at a traffic enforcement company operating speed camera systems across all regions of Brazil.

Led observability projects using Prometheus, Zabbix, and Grafana. Worked closely with maintenance support teams to understand their needs and create objective dashboards, reducing MTTD and improving SLO/SLA performance by around 20%.

Python tech lead, responsible for projects focused on the secure and encrypted transmission of vehicle images to government systems, including the CSI - Security and Intelligence Center, one of Brazil's leading Smart City as a Service initiatives.

Implemented the company's first Knowledge Base by creating a *Docs as Code* framework based on Sphinx.

***Technologies**: Python, Prometheus, Grafana, Loki, Zabbix, OpenStreetMap, RabbitMQ, ZeroMQ, Ansible, AWX, GitLab, Sphinx, Linux.*
